A Project Report Submitted to

Faculty of Management, Tribhuvan University

in partial fulfillment of the requirements for the degree of

Bachelor of Information Management(BIM)

Bharatpur

2025

STUDENT DECLARATION

This is to certify that I have completed the Project entitled "Vehicle Rental System" under the guidance of "Pravesh Koirala" in partial fulfillment of the requirements for the degree of **Bachelor of Information Management** at Faculty of Management, Tribhuvan University. This is my original work, and I have not submitted it elsewhere earlier.

Date:

.....

Tara Paudel

CERTIFICATE FROM THE SUPERVISOR

This is to certify that the project entitled “**Vehicle Rental System**” is an academic work done by “**Tara Paudel**” submitted in partial fulfillment of the requirement for the degree of **Bachelor of Information Management** at Faculty of Management, Tribhuvan University under my guidance and supervision. To the best of my knowledge, the information presented by her in the project report has not been submitted earlier.

.....

Pravesh Koirala

Date:

APPROVAL SHEET

This is to certify the project entitled “**Vehicle Rental System**” submitted by “**Tara Paudel**” has been examined and approved. In our opinion, it meets the required scope and quality standards for a project submitted in partial fulfillment of the requirement for the degree of Bachelors of Information Management.

Approval Panel:

S. No.	Name	Designation	Signature
1	Pravesh Koirala	Project Supervisor	
2	Nirjan Ghimire	Program Coordinator	
3	Robin Shrestha	Internal Examiner	
4		External Examiner	

Date of Defense:

Department: Information Management

Faculty: Faculty of Management

ACKNOWLEDGEMENT

I extend my heartfelt gratitude to all those who have been instrumental in the completion of the Vehicle Rental System. Firstly, I would like to express my sincere appreciation to my supervisor for their invaluable guidance, encouragement, and expertise throughout this project. Their insights and support played a crucial role in shaping the system's development and success. I am also deeply thankful to the faculty members at the Department of Computer Application for equipping me with the necessary knowledge and resources to undertake this project. Their teachings and mentorship have been invaluable in my journey.

Furthermore, I would like to extend my gratitude to the vehicle rental company for their cooperation and assistance in providing the necessary data and requirements, which helped in designing a system that meets real-world needs. My deepest appreciation goes to my family and friends for their unwavering support, motivation, and understanding throughout this endeavor. Their encouragement has been a constant source of inspiration.

Lastly, I am grateful to all the users who participated in testing and provided valuable feedback. Your suggestions and inputs have been instrumental in refining and improving the system, ensuring a seamless and efficient experience.

Tara Paudel

ABSTRACT

This project presents the design and development of a vehicle rental system that provides a user-friendly and efficient platform for customers to rent vehicles online. The system allows users to browse available vehicles, request a driver if needed, and complete rental bookings seamlessly. Key functionalities include vehicle categorization, user management, rental order processing, and booking confirmation. The primary objective of this project is to implement core concepts of database management, web development in the context of vehicle rentals. Built using Django for the backend, HTML, CSS, Tailwind, JavaScript for the frontend, and SQLite as the database, the system ensures smooth functionality tailored for a single-company rental service.

Additionally, this project focuses on providing a responsive, and structured platform while enhancing our technical expertise through real-world application. The system serves as a foundation for further enhancements, such as integrating multiple branches, refining the admin panel, and improving the user experience

CHAPTER 1: INTRODUCTION

1.1 Introduction

This report documents the development of the **Vehicle Rental Service System**, a web-based application created as part of the Bachelor's in Information Management program. The system aims to provide a seamless, real-time platform for users to rent vehicles and track vehicle availability. It allows administrators to efficiently manage the fleet, customer details, and rental transactions, ensuring an organized and streamlined process for vehicle rental.

By offering an intuitive interface, the system empowers users to make informed decisions on vehicle rentals based on availability, price, and location. Admins have the ability to manage vehicle listings, monitor bookings, and update rental terms, ensuring smooth operations. While the website does not facilitate direct payments, it serves as a reliable platform for vehicle rentals, offering users an overview of options available.

The Vehicle Rental Service System addresses a growing need for efficient vehicle rental management and streamlined user experience. This project contributes to improving customer satisfaction, operational efficiency, and overall transparency within the vehicle rental industry.

1.2 Problem Statement

In Nepal, vehicle rental services are an essential part of the transportation industry, providing flexible travel options for individuals and businesses. However, many existing vehicle rental systems face significant challenges related to usability, efficiency, security, and service reliability. Traditional rental processes often involve manual booking, unclear pricing structures, and lack of real-time availability, leading to customer dissatisfaction and operational inefficiencies.

This project aims to develop a modern, user-friendly, and secure vehicle rental system that enhances the rental experience for both customers and the company. The system will offer an intuitive online booking process, real-time vehicle availability updates, secure customer authentication, and an efficient reservation management system. Customers will be able to select vehicles based on their needs, request drivers where applicable, and receive clear pricing details, ensuring a seamless and transparent rental process.

By implementing a digital vehicle rental platform, this project seeks to address key challenges such as booking inefficiencies, lack of automation, security risks, and

operational difficulties, ultimately improving customer satisfaction and optimizing business operations.

1.3 Objectives

The primary objectives of this project are:

- To help users easily rent vehicle online.
- To help company manage vehicles and bookings more efficiently.

1.4 Review of Related Work and Literature

In today's busy world, convenient and quick access to transportation is essential. Vehicle rental systems like Infinite Ride help simplify the process of booking vehicles, making it easier for users to plan their travel. Studies have shown that such digital platforms reduce errors and improve user satisfaction by providing easy online access to different vehicle options. These systems reflect a growing trend toward efficient, user-friendly services that meet the needs of modern customers, especially in regions where vehicle rental is an important part of daily travel.

- **Sasto Rental:** Sasto Rental, established in 2018, is a popular vehicle rental platform in Nepal offering cars, SUVs, and motorcycles. It provides easy online booking with features like vehicle availability, customer reviews, and clear pricing. However, it has limited payment options and slower support during busy times. It mainly serves urban areas and struggles to reach remote regions.
- **Nepal Vehicle Rental:** Nepal Vehicle Rental, established in 2015, is a well-known service catering to tourists and locals in Kathmandu and nearby areas. The platform offers a variety of vehicles and focuses on quality and convenience. However, it lacks advanced features like real-time availability and modern booking interfaces, which limits its competitiveness and market reach.
- **Easy Rent Nepal:** Easy Rent Nepal is a customer-friendly platform offering sedans, SUVs, and 4WDs for rent. It serves business travelers and families with both chauffeur-driven and self-drive options and flexible rental periods. However, its prices are higher than budget services, and it mainly operates in major cities. Extra charges may apply for long-distance travel.

1.5 Development Methodology

The Software Development Life Cycle (SDLC) is a structured process that guides the development, maintenance, and enhancement of software.

For this project, we are using the **Agile methodology**, which focuses on iterative development and continuous feedback. Agile allows for breaking down the development into smaller cycles, enabling flexibility and responsiveness to changing requirements. Each iteration is adjusted based on feedback from users and stakeholders, ensuring that the system evolves to meet their needs. This approach is ideal for small-scale projects like the vehicle rental system, allowing for frequent updates and improvements.

Figure 1.1: Agile Method

1.4 Scope and Limitations

1.4.1 Scope

- User can book vehicle through online website.
- See Real time vehicle Availability.

1.4.2 Limitations

- Does not support online payment transactions.
- Initial deployment focuses on a specific city, limiting coverage.

1.5 Report Organization

This study has been organized into the following three chapters:

Chapter 1: This covers the introduction, problem statements, objectives, literature review, development methodology, scope and limitations.

Chapter 2: This covers the System Development Process (Analysis phase, Design, Testing and Implementation phases).

Chapter 3: This covers the Conclusion and Recommendation

CHAPTER 2: SYSTEM DEVELOPMENT PROCESS

2.1 System Analysis

System analysis is the process of evaluating the vehicle rental platform's requirements, design, and feasibility. It involves breaking down the system into its core components to understand their interaction and ensure the platform meets the project's goals.

2.1.1 Requirement Analysis

Requirement analysis is a critical first step in the development process, forming the foundation for the success of the **Infinite Ride** vehicle rental platform. This phase involves gathering and defining both functional and non-functional requirements to ensure the system addresses business needs and provides value to users.

1. Functional Requirements:

The Functional Requirements of Infinite Ride can be demonstrated using Use Case diagram as:

Figure 2.1: Use Case Diagram

2. Non-Functional Requirements

- **Performance:** The system should maintain an average page load time of under 5 second to provide a smooth and responsive user experience.
- **Scalability:** The system should be scalable both horizontally and vertically, allowing it to handle increased traffic as the user base grows.
- **Availability:** The platform must maintain a high availability, targeting 99.9% uptime to ensure ensuring that customers can access the system for vehicle bookings at any time.
- **Security:** User passwords and sensitive data must be securely handled using Django's built-in authentication system, with strong encryption algorithms such as PBKDF2, Argon2, or bcrypt.
- **User Interface:** The platform should have a clean, intuitive, and user-friendly interface, allowing users to easily search and book vehicles.
- **Cross-Browser Compatibility:** The platform must work reliably across major web browser including Chrome, Firefox, Safari and Edge

2.1.2 Feasibility Study

- **Technical Feasibility:**

The website leverages compatible technologies for front-end (e.g., HTML, CSS, Bootstrap) and back-end (Python Django). Integration with databases and APIs ensures technical reliability.

- **Operational Feasibility:**

The system meets the operational needs of vehicle rental services by providing features like real-time vehicle reservation management.

- **Economic Feasibility:**

The project is cost-effective, requiring minimal investments in hardware and software, with long-term benefits in market transparency and user satisfaction.

- **Schedule Feasibility:**

The project follows a clear development timeline, ensuring timely delivery of features like user registration, search functionalities, and booking management.

2.1.3 Structure Oriented Modeling

i. Data Flow Diagram

A Data Flow Diagram (DFD) is a graphical representation that illustrates how data flows within a system. It shows the movement of data between external entities, processes, and data stores, helping to analyze and design system processes clearly. DFDs are often used to break down complex systems into simpler, understandable parts.

Level 0 (Context Diagram): Shows the entire system as a single process with external entities and data flow.

Figure 2.3:DFD Level 0

Level 1 DFD: Breaks the main process into sub-processes, showing more detail about data handling.

Figure 2.4:DFD Level 1

Level 2 : Further breaks down Level 1 processes for deeper understanding of complex systems.

Figure 2.5:DFD Level 2

ii. ER Diagram

An ER diagram is a type of data modeling diagram that shows entities, their attributes, and the relationships between them. It helps in designing and understanding how data is connected and stored within a system.

Figure 2.6:ER-Diagram

i. Schema Diagram

A schema diagram shows the structure of a database, including tables, columns, data types, and their relationships. It helps visualize how data is organized and connected.

Figure 2.7:Schema Diagram

ii. Architecture Diagram

Figure 2.8: Architecture Diagram

2.2 System Design

Infinite Ride (Vehicle Rental System) is a web-based platform that allows users to browse available vehicles, check availability, and make reservations for rentals. The system also includes features such as user registration and login, booking management, rental history tracking, and an admin dashboard for managing vehicles and bookings.

2.2.1 User Interface

Home Page

Figure 2.9: Home Page

Admin Dashboard

Figure 2.10: Admin Dashboard

2.3 Implementation

To ensure effective project management, planning, development, and deployment, a range of tools and technologies were used during the implementation of the vehicle rental system. Utilizing CASE tools for planning and design, along with programming tools for development, the process was structured around well-defined workflows. This approach ensured the system was delivered with optimal performance, usability, and functionality.

2.3.1 Tools and Technologies Used

- **HTML & CSS:** HTML was used for structuring the content on the website, while CSS was used for styling and layout design.
- **Bootstrap:** Bootstrap was utilized for responsive design and pre-built UI components, ensuring a consistent and mobile-friendly user interface.
- **JavaScript:** JavaScript was used to add interactivity and dynamic elements to enhance user engagement.
- **Tailwind CSS:** Tailwind CSS was employed for styling the admin dashboard, offering a utility-first approach for rapid design adjustments.
- **Django:** Django served as the back-end framework, providing a secure and efficient environment for handling authentication, routing, and database management.
- **SQLite:** SQLite was used as the database management system to store and manage user accounts, vehicle and bookings.

Table 2.1:Tools Used

Software	Purpose
VS Code	Code Editor
Django	Backend Framework
Draw.io	Diagram Design
Brave	Web Browser for Testing
SQLite	Database
Microsoft Word	Documentation
Microsoft PowerPoint	Presentation

2.3.2 Module Description

Table 2.2:Authentication module

Element	Description
Purpose	To securely handle registration, login, logout, and authentication processes.
Functionality	registration, login, logout, password validation, session management, and access control based on roles.
Inputs	Email, Password and other credentials (during registration or login).
Outputs	Login session, user profile access, error messages (invalid credentials etc.).
Users	Customer and Admin

Table 2.3:Admin dashboard module

Element	Description
Purpose	Provides tools for admins to manage the system and monitor activities.
Functionality	Add, edit, delete vehicles, manage user bookings, monitor vehicles availability, generate reports.
Inputs	Admin actions (data updates, and status changes).
Outputs	Reports, User data, booking management
Users	Admin only.

Table 2.4:User dashboard module

Element	Description
Purpose	view and manage their bookings and profile.
Functionality	View available vehicles, make new bookings, view booking history, update profile, submit reviews.
Inputs	vehicle choice, booking details, profile updates, reviews.
Outputs	booking confirmation, booking history display, profile update confirmation, review.
Users	customers only.

2.4 Testing

2.4.1 Test Case for Unit Testing

The goal of unit testing is to confirm that each system component such as functions, methods, or classes works. Before incorporating them into the broader system, it ensures that every component of the program functions properly when used separately.

a) For User Registration

Table 2.5:Test Case for User Registration

Test case ID	Test Scenario	Test Steps	Input Test Data	Expected Results	Actual Results	Pass/Fail
TC-1	Check Signup activity with valid data	- Open the site and go to sign up. - Fill Up the form and click register.	-Name: Tara -Email: tara1@gmail.com -phone:9876543210 -password: password123	User should get “Account Successfully Created” message and redirected to login page	As expected,	Pass
TC-2	Check Signup activity with invalid data	- Open the site and go to sign up. - Fill Up the form and click register.	-Name: Tara -Email: tara1@gmail.com -phone:9876543 -password: pass	User should Get “phone number should be 10 digits”, “Password should be 8 character long” message	As expected,	Pass

b) For User Log In

Table 2.6:Test Case for User Login

Test Case Id	Test Scenario	Test Steps	Input Test Data	Expected Results	Actual Results	Pass/Fail
TC-3	Check Sign In activity with valid data	- Open the site and go to login page. - Enter email and password and click login.	-Email: tara1@gmail.com -Password: password123	User should be logged in and gets redirected to home page.	As Expected,	Pass
TC-4	Check Sign In activity with invalid data	- Open the site and go to login page. - Enter email and password and click login.	-Email: tara1@gmail.com -Password: password	User should get “Invalid password” error message.	As Expected,	Pass

c) For Vehicle Booking

Table 2.7: Test Case for Vehicle Booking

Test case ID	Test Scenario	Test Steps	Expected Results	Actual Results	Pass/Fail
TC-6	Verify vehicle booking process	- Open the site - Browse available vehicles - Click "View Details" - Click "Book Now" - Fill in the booking form - Submit the form - Confirm booking	confirmation message should be displayed saying "Booked"	As expected,	Pass

2.4.2 Test Case for System Testing

System testing is a comprehensive stage where the entire application is examined to ensure that all components function as expected. It involves testing every aspect of the vehicle rental system, including interactions between the front-end and back-end.

- **Test for User Registration and Login Flow:** We tested whether new users could register and log in using their email and password. The system successfully authenticated registered users and redirected them to the home page. Invalid credentials resulted in an error message.

- **Test for Vehicle Booking Process:**

We verified that:

1. The "Book Now" button was disabled when a vehicle was unavailable.
2. When a vehicle was available, clicking "Book Now" opened a form.
3. Users could enter start date, end date, and other required details.
4. The system accurately calculated and displayed the total rental amount.
5. Clicking the "Confirm Booking" button successfully booked the vehicle.
6. A "Booked" confirmation message was displayed.

- **Test for Booking History and Status Updates:** Users could view their booking history, which listed all previous and ongoing bookings. Each booking displayed its status (e.g. Pending, Confirmed, Cancelled and Completed).
- **Test for Review Submission After Booking Completion:** After a booking was marked "Completed", users could access the review section, submitted reviews were successfully stored and displayed.
- **Test for Bill Generation and Payment Status:** After confirming a booking, users could view their bill, which displayed. Once the user paid the amount, the payment status changed to "Paid" in the system by admin.
- **Test for User Role and Permissions:**
 1. Registered users could only book vehicles, view bills, and submit reviews.
 2. Admins had full control over Managing vehicle listings, Viewing and updating bookings, Changing booking/payment statuses, Moderating reviews.
 3. Unauthorized actions were restricted.

CHAPTER 3: CONCLUSION AND RECOMMENDATION

3.1 Summery

Infinite Ride is a user-friendly vehicle rental system developed to streamline the booking process in Nepal. It enables customers to browse available vehicles, make reservations, and receive bills upon confirmation. The platform offers key features such as availability, booking history, and digital receipts, all designed to improve operational efficiency and user convenience.

The system organizes vehicles into clear categories and provides intuitive booking tools, including driver options for some vehicles. Administrators can efficiently manage vehicle listings, customer bookings, and user reviews through a dedicated dashboard. Although it currently lacks payment gateway integration, Infinite Ride has proven effective in reducing manual effort and building customer trust through a responsive and transparent interface.

3.2 Conclusion

Infinite Ride offers a promising solution for vehicle rentals in Nepal by providing a user-friendly platform for booking vehicles. While the system works efficiently for vehicle selection, booking, and bill generation, there are areas for improvement, particularly in handling user behavior and optimizing performance during high traffic times. Additionally, the lack of an integrated payment gateway present some challenges. However, with strategic planning and continuous system enhancements Infinite Ride can navigate these risks and provide an efficient, reliable, and secure service to customers across Nepal. By focusing on operational improvements and addressing user concerns, Infinite Ride has the potential to become a trusted and competitive service in the growing vehicle rental market.

3.3 Recommendation

- **Integrate a Payment Gateway:** Allow users to make secure online payments during booking to increase convenience and reduce last-minute cancellations.
- **Mobile Application:** Create a mobile app to make vehicle browsing and booking more accessible and convenient for users.
- **Real-Time GPS Tracking:** Implement GPS tracking for vehicles to offer location transparency.
